PREVIEW — LAUNCH · MEMORY · SCROLLING · PACKAGE SIZE · STABILITY

Free sample — 5 checks from the iOS Performance Audit Checklist

One check from each section of the full audit, reproduced here with the same wording. Each one gives you what to measure, the exact procedure, and the pass bar — enough to run it on your next build before you decide whether the other 55 checks are worth it.

01 LAUNCH — CHECK 1 OF 60

Measure cold, warm, and hot launch as separate numbers

WHAT TO CHECK	The app reports three distinct launch durations instead of one blended average.
HOW TO TEST	Cold launch = process not in memory (force-quit, then launch). Warm launch = process still resident. Use `XCTApplicationLaunchMetric` in a UI test and check Xcode Organizer › Launch Time and MetricKit `MXAppLaunchMetric`.
PASS CRITERIA	Cold and warm are reported separately; cold launch p50 and p95 are both tracked per app version.

02 MEMORY — CHECK 13 OF 60

Measure peak and steady-state memory on a physical device

WHAT TO CHECK	Peak footprint and steady-state footprint for a realistic session.
HOW TO TEST	Use the Xcode memory report, the Allocations instrument (All Heap & Anonymous VM), and MetricKit `MXMemoryMetric` peak memory. Exercise a full session: launch, browse, open detail, return, background, foreground.
PASS CRITERIA	Peak ≤ 200 MB on the oldest supported device for a typical session, and steady state returns within 10% of the pre-session value.

03 SCROLLING — CHECK 26 OF 60

Track animation hitches during scrolling

WHAT TO CHECK	Hitch time and hitch ratio while scrolling the heaviest list.
HOW TO TEST	Use Instruments › Animation Hitches and MetricKit `MXAnimationMetric`. Measure a 30-second automated scroll on the densest screen.
PASS CRITERIA	Hitch time ratio below 5 ms per second of scrolling; no single hitch longer than 100 ms.

04 PACKAGE SIZE — CHECK 37 OF 60

Measure the thinned App Store download size

WHAT TO CHECK	The size users actually download, not the size of the `.app` on disk or the universal archive.
HOW TO TEST	Export an App Store build (Organizer › Distribute App › App Store Connect › Export) and open the generated **App Thinning Size Report**. Compare the per-device variant sizes.
PASS CRITERIA	Thinned download size is within the product budget on the primary device family; the audit records the exact report values.

05 STABILITY

CHECK 49 OF 60

Establish a crash-free session baseline

WHAT TO CHECK	Crash-free sessions and crash-free users are tracked per version, with a release threshold.
HOW TO TEST	Read App Store Connect › Metrics or your crash backend; segment by app version, device, and iOS version.
PASS CRITERIA	Crash-free sessions ≥ 99.5% on the current release (set and document a stricter target for critical apps); no single crash signature above 0.5% of sessions.

MEASUREMENT RULE

Never accept a simulator number for launch time, memory footprint, or hitch rate. The simulator has no jetsam limits, no thermal throttling, and different CPU characteristics.

THE OTHER 55 CHECKS

Ready to audit the whole build?

The full checklist runs all 60 checks across launch, memory, scrolling, package size, and stability, each with the same test procedure and a pass bar you can mark pass or fail.
